

Riverside Ave, Newark, NJ (Harrington & Rosoff)

10/20/10

The TetraTech site assessment has determined that the following items on site appear to be removal eligible:

- Asbestos throughout Bldg 7 and in Bldg 12 basement, and outdoor ACM
- 4 ASTs in Bldg 7
- Resins in Bldg 7 process lines
- 2 ASTs in Bldg 12 basement
- 5 drums/carboys
- Pigments in 2 Bldg 12 hoppers

The determination of removal eligibility for the sediments in the Bldg 7 & 12 subbasements, 10 12k gal USTs, and site soils will depend on the results of the ERT/SERAS soil, GW, and Passaic River sediment sampling analysis, which is currently being reviewed. The final ERT/SERAS assessment summary is expected by the end of this month.

TIC analysis has been postponed pending the results of the VOC/SVOC review.

Pending the results of the ERT/SERAS assessment summary, an Action Memo will be prepared to address all of the removal eligible items on site.

At the request of ERRD Pre-Remedial, soil and Passaic River sediment samples will be analyzed for dioxins/furans for potential hazard ranking of the site.

PPG, a former owner operator of the site, has responded to EPA's 104(e), which is currently being reviewed by ORC.
